CSE 3318 Notes 2: Growth of Functions

(Last updated 8/1/22 2:58 PM)

CLRS Chapter 3

Why constants are annoying . . .

Problem Instance of Size n (n = size of data structure or input)

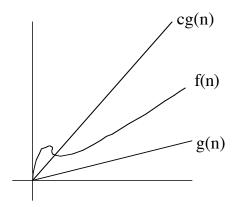

Resources Consumed? (time, memory, processors, bandwidth)
(Asides: https://dl-acm-org.ezproxy.uta.edu/doi/10.1145/2976758,
Compiler Explorer: https://godbolt.org)

Need to compare time and space usage of various algorithms for a problem.

2.A. ASYMPTOTIC NOTATION

O(g(n)) is a *set* of functions:

$$f(n) \in O(g(n))$$
 iff $\exists c$ and n_0 such that $0 \le f(n) \le cg(n)$ when $n \ge n_0$

Theorem: If $\lim_{n\to\infty} \frac{f(n)}{g(n)}$ is a constant, then $f(n) \in O(g(n))$.

$$f(n) = n^{2}, g(n) = n^{3} \quad \lim_{n \to \infty} \frac{n^{2}}{n^{3}} = \lim_{n \to \infty} \frac{2n}{3n^{2}} = \lim_{n \to \infty} \frac{2}{6n} = 0 \Rightarrow n^{2} \in O(n^{3})$$

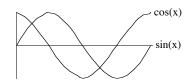

$$f(n) = n^{3}, g(n) = n^{2} \quad \lim_{n \to \infty} \frac{n^{3}}{n^{2}} = \lim_{n \to \infty} \frac{3n^{2}}{2n} = \lim_{n \to \infty} \frac{6n}{2} = unbounded \Rightarrow n^{3} \notin O(n^{2})$$

$$f(n) = 3n^2 + 2n - 3, g(n) = 5n^2 - n + 2$$

$$\lim_{n \to \infty} \frac{3n^2 + 2n - 3}{5n^2 - n + 2} = \lim_{n \to \infty} \frac{6n + 2}{10n - 1} = \lim_{n \to \infty} \frac{6}{10} = \frac{3}{5} \Rightarrow 3n^2 + 2n - 3 \in O(5n^2 - n + 2)$$

Conclusion: Toss out low-order terms $n^k \in O(n^l)$ if $l \ge k$.

Is $\sin(x) \in O(\cos(x))$?

Is $\ln(x) \in O(\log_{10}(x))$? [But in some situations, like Notes 04, log details are important]

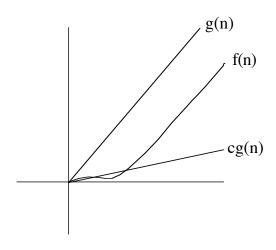

Is $2^n \in O(n^k)$ for some fixed k?

$$n^k \in O(2^n)$$
 for any k . General case, $n^k \in O(c^n)$ for any $c > 1$

Aside: There are problems in the gap between polynomial and exponential: https://en.wikipedia.org/wiki/Graph_isomorphism_problem

 $\Omega(g(n))$ is a *set* of functions:

$$f(n) \in \Omega(g(n))$$
 iff $\exists c$ and n_0 such that $0 \le cg(n) \le f(n)$ $(c > 0)$ when $n \ge n_0$

Theorem: If $\lim_{n\to\infty} \frac{g(n)}{f(n)}$ is a constant, then $f(n) \in \Omega(g(n))$.

$$g(n) = n^2$$
, $f(n) = 3n^3 \lim_{n \to \infty} \frac{n^2}{3n^3} = \lim_{n \to \infty} \frac{2n}{9n^2} = \lim_{n \to \infty} \frac{2}{18n} = 0 \Rightarrow n^3 \in \Omega(n^2)$

Upper bounds (O()) are for particular *algorithms*.

Lower bounds $(\Omega())$ are for indicating the inherent difficulty of *problems*.

The hunt for an optimal algorithm . . .

Aside: https://rjlipton.wpcomstaging.com/2012/02/01/a-brief-history-of-matrix-product/

Best upper bound: $O(n^{2.373})$ Best lower bound: $O(n^2)$

Θ-notation (asymptotically tight bound) – Used to express time for worst-case instances for algorithm

$$f(n) \in \Theta(g(n))$$
 iff $f(n) \in O(g(n))$ and $f(n) \in \Omega(g(n))$.

Theorem: If $\lim_{n\to\infty} \frac{g(n)}{f(n)}$ is a constant > 0, then $f(n) \in \Theta(g(n))$.

$$f(n) = 3n^2 + 2n - 3$$
, $g(n) = 5n^2 + n - 1$

$$\lim_{n \to \infty} \frac{3n^2 + 2n - 3}{5n^2 + n - 1} = \lim_{n \to \infty} \frac{6n + 2}{10n + 1} = \lim_{n \to \infty} \frac{6}{10} = \frac{3}{5} \Rightarrow 3n^2 + 2n - 3 \in \Theta(5n^2 + n - 1)$$

 $\Theta(f(n))$ is an equivalence relation . . .

 $g(n) \in \Theta(f(n)) \Leftrightarrow f(n) \in \Theta(g(n))$ [Doesn't work for O or Ω] Symmetric:

 $f(n) \in \Theta(f(n))$ [Works for O and Ω] Reflexive:

 $f(n) \in \Theta(g(n))$ and $g(n) \in \Theta(h(n)) \Rightarrow f(n) \in \Theta(h(n))$ [Works for O and Ω] Transitive:

Accepted abuses of asymptotic notation. (CLRS, p. 58)

1.
$$n^2 + n = \Theta(n^2)$$
 means $n^2 + n \in \Theta(n^2)$.

2.
$$3n^2 + 2n + 1 = 3n^2 + \Theta(n)$$
 means . . .

3.
$$2 + 3\Theta(n) = n + \Theta(n)$$
 means . . .

Aside: Indicating that a bound could/might be improved:

o(f) = O(f) -
$$\Theta(f)$$
 $\omega(f) = \Omega(f) - \Theta(f)$
 $n^2 \in o(n^3)$ $\frac{1}{n^2} \in \omega\left(\frac{1}{n^3}\right)$

Example: p. 46 of Demaine & O'Rourke, Geometric Folding Algorithms: Linkages, Origami, & Polyhedra, Cambridge Univ. Press, 2007. (https://www.amazon.com/dp/0521857570/)

"Open Problem 4.1: Faster Generic Rigidity in 2D. Is there a $o(n^2)$ -time algorithm to test generic rigidity of a given graph with n vertices?" (https://minerva.cs.mtholyoke.edu/scholarship/rigidity-theory/getting-started-with-combinatorial-rigidity-theory)

2.B. APPLYING ASYMPTOTIC ANALYSIS TO CODE SEGMENTS

```
for (i=0; i<n; i++)
  for (j=0; j< n; j++)
  {
    c[i][j] = 0;
    for (k=0; k< n; k++)
      c[i][j] += a[i][k]*b[k][j];
  }
min=max=a[0];
for (i=1; i<n; i++)
  if (a[i]<min)</pre>
    min=a[i];
  else if (a[i]>max)
    max=a[i];
equalCount=unequalCount=0;
for (i=0; i<n; i++)
  if (a[i]==val)
    equalCount++;
    unequalCount++;
```

```
equalCount=0;
for (i=0; i<n; i++)
  if (a[i]==val)
      equalCount++;
unequalCount=0;
for (i=0; i<n; i++)
  if (a[i]!=val)
    unequalCount++;</pre>
```

Linear time or exponential time?

```
for (i=0; i<k; i++);
```

Test Problem: Perform an asymptotic analysis for the following code segment to determine an appropriate Θ set for the time used.

```
sum=0;
for (i=0; i<n; i=i+2)
  for (j=1; j<n; j=j+j)
   sum=sum + a[i]/a[j];</pre>
```

LU Decomposition (Gaussian Elimination, CSE 3380) - aside, useful as practice

```
#include <stdio.h>
                                             for (i=1;i<=n;i++)
#include <stdlib.h>
                                               piv[i]=i;
#include <math.h>
#define MAX SLOTS 10
                                             for (k=1; k \le n-1; k++)
typedef char boolean;
int num_slots,i,j;
                                               printf("iteration %d\n",k);
double slot[MAX_SLOTS+1];
                                               amax=0.0;
                                               for (ell1=k;ell1<=n;ell1++)</pre>
typedef double row[MAX_SLOTS+2];
row ab[MAX_SLOTS+2],ab1[MAX_SLOTS+2];
                                                 if (amax<fabs(ab[ell1][k]))</pre>
                                                   amax=fabs(ab[ell1][k]);
void LU()
//SOLVES SYSTEM OF LINEAR EQUATIONS.
                                                   ell=ell1;
//TAKEN FROM M.J. Quinn, P. 147
//CODE HAS BEEN MODIFIED TO PRELOAD AB
                                               if (amax==0.0)
//TO SAVE SPACE BY NOT STORING A AND B
                                                 printf("singular matrix\n");
//SOLUTION IS PLACED IN SLOT[*]
                                                 abort();
                                               printf("pivoting row %d\n",ell);
double amax, temp, c, sum;
int n,i,j,k,k1,ell,ell1,itemp;
                                               itemp=piv[ell];
                                               piv[ell]=piv[k];
row y;
int piv[MAX SLOTS+1];
                                               piv[k]=itemp;
n=num_slots;
```

```
for (k1=1;k1 \le k;k1++)
                                              printf("enter n: ");
    temp=ab[ell][k1];
                                              scanf("%d",&num_slots);
    ab[ell][k1]=ab[k][k1];
    ab[k][k1]=temp;
                                              printf("enter matrix and column\n");
                                              for (i=1;i<=num_slots;i++)</pre>
                                                for (j=1;j<=num_slots+1;j++)</pre>
                                                  scanf("%lf",&ab[i][j]);
  c=1.0/ab[k][k];
  for (i=k+1;i<=n;i++)
                                              for (i=1;i<=num slots;i++)</pre>
                                                for (j=1;j<=num_slots+1;j++)</pre>
    ab[i][k] *= c;
                                                  ab1[i][j]=ab[i][j];
  for (j=k+1; j<=n; j++)
                                              printf("input:\n");
    temp=ab[ell][j];

                                              for (i=1;i<=num_slots;i++)</pre>
    sum+=ab[i][j]*slot[j];
  slot[i]=(y[i]-sum)/ab[i][i];
}
                                                sum=0.0;
}
                                                for (j=1;j<=num_slots;j++)</pre>
                                                  sum+=ab1[i][j]*slot[j];
int main()
                                                printf("%f\n",sum);
int i,j,k;
double sum, L, U;
```

2.C. DEMONSTRATING FUNDAMENTAL RESULTS FOR ASYMPTOTIC NOTATION

Exercise 3.2-1: f(n) and g(n) are positive functions. Show $\max(f(n),g(n)) = \Theta(f(n)+g(n))$

O: Since $f(n) \le f(n) + g(n)$ and $g(n) \le f(n) + g(n)$

 $\max(f(n),g(n)) \le f(n) + g(n)$ for all n, so $n_0 = 0$ and c = 1

Ω: Must have $c(f(n) + g(n)) \le \max(f(n), g(n))$, so choose $n_0 = 0$ and $c \le 1/2$ [Consider f(n) = g(n)]

Test Problem: Prove that if $g(n) \in \Omega(f(n))$ then $f(n) \in O(g(n))$.

 $cf(n) \le g(n)$ when $n \ge n_0$

So, $f(n) \le \frac{1}{c} g(n)$ when $n \ge n_0$

Need $f(n) \le dg(n)$ when $n \ge n_1$

Choose $d = \frac{1}{c}$ and $n_1 = n_0$

2.D. MISCELLANEOUS

$$floor(x) = |x|$$
 Largest integer $\leq x$

$$[2.5] = ?$$
 $[-2.5] = ?$

$$ceiling(x) = [x]$$

Smallest integer
$$\geq x$$

$$[2.5] = ?$$
 $[-2.5] = ?$

Worst-case number of probes for binary search: $|\lg n| + 1$

Consider worst-case searches on tables with 15 elements (4) and 16 elements (5).

Review:

$$2^{n} ? O(3^{n}) \qquad 2^{n} ? \Omega(3^{n}) \qquad \lg(2^{n}) = n \qquad \lg(3^{n}) = n \lg 3 \qquad \lg(2^{n}) = \Theta(\lg(3^{n}))$$

Factorials:

$$n! = \prod_{i=1}^{n} i = 1 \cdot 2 \cdot 3 \cdot \dots \cdot n$$

$$\lg(n!) = \sum_{i=1}^{n} \lg i \in \Theta(n \lg n)$$
[Using Notes 03.C and https://www.wolframalpha.com]

<u>n</u>	n!	$\lg(n!)$	<i>n</i> lg <i>n</i>

O:
$$n! \le n^n$$

 $\lg(n!) \le n \lg n$
 $\lg(n!) \in O(n \lg n)$

$$\Omega: \qquad n! = 1 \bullet \dots \bullet \frac{n}{2} \bullet \left(\frac{n}{2} + 1\right) \bullet \left(\frac{n}{2} + 2\right) \bullet \dots \bullet n$$

$$\geq 1 \bullet \dots \bullet \frac{n}{2} \bullet (\sqrt{n})^{\frac{n}{2}} \qquad \qquad \frac{n}{2} + k \geq \sqrt{n} \text{ for } n > 3 \text{ and } k \geq 0$$

$$\geq (\sqrt{n})^{\frac{n}{2}} \qquad \qquad 1 \bullet \dots \bullet \frac{n}{2} \geq 1$$

$$\lg(n!) \geq \lg(\sqrt{n})^{\frac{n}{2}} = \frac{n}{2} \frac{\lg n}{2} = \frac{1}{4} n \lg n$$
